1. Executive Summary

TalentAI introduces a sustainable AI-driven talent economy, where market incentives, governance, and real-world recruitment flows are fully synchronized through the veTAI token model.

The system aligns stakeholders, users, companies, and the DAO, via an incentive flywheel that converts platform revenues into *buybacks*, *staking rewards*, and *liquidity reinforcement*.

At its core, TAI functions as a value bridge between talent demand and AI-based evaluation services.

Employers deposit fiat (USD/HBAR) for job listings and assessments, while users engage in skill verifications and earn tokenized rewards. Part of these revenues flow directly into the on-chain Smart Treasury, which splits 25 % across four streams:

- Buybacks & market absorption
- veTAI staking reward
- DAO operations
- AI marketplace developer incentives

Economic Design Highlights

ve(33) Alignment Model: Long-term TAI lockers receive veTAI voting power and yield multipliers. The longer the lock, the higher the governance weight and reward rate, ensuring a direct correlation between *commitment and influence*.

Buyback-Reinforced Liquidity: Real revenues are recycled into buybacks that strengthen liquidity pools and mitigate sell pressure, creating a self-reinforcing “price support → yield → lock → reduced float” cycle.

Predictive Stress-Testing: All token flows are simulated using Nomiks’ Monte-Carlo GBM and power-law liquidity engine, quantifying drawdown probabilities, LCR resilience, and emission depletion rates.

Key Investor Highlights

- Active B2B demand: enterprise HR automation market growing +24% YoY.
- AI modules and credential NFTs create real transaction flow.
- Revenue sharing, staking, and buyback design ensure token-holder alignment.
- Hedera network provides regulatory-grade transparency and scalability.
- Conservative FDV (\$25M) vs sector peers (\$40–70M median).

TalentAI aims to bridge the gap between **AI trust and human capital markets**, turning credentials and assessments into liquid, composable digital assets.

2. Platform Overview

TalentAI is a **modular, agent-based recruitment infrastructure** built on three technological pillars:

Pillar	Description
Artificial Intelligence	Natural, conversational agents evaluating candidates' technical and soft skills through real-time voice & video.
Hedera Blockchain (HTS & HCS)	Immutable credential verification, inter-agent communication, and decentralized reputation tracking.
Token Economy (TAI Token)	Medium of exchange and governance instrument underpinning TalentAI's self-sustaining ecosystem.

Core Modules

- AI Interview & Skill Engine
- Blockchain Credential NFTs (Soulbound)
- Recruiter Dashboard with Matching Algorithm
- Analytics & Reporting for Companies
- Tokenized Marketplace for Assessments and Training

3. The Token: TAI

Parameters	Value
Name	TalentAI Token
Symbol	TAI
Network	Hedera Hashgraph (HTS)
Total Supply	1,000,000,000 TAI
Type	Utility + Governance
Decimals	8
Emission Model	Fixed supply, with staking emissions & buyback replenishment
Treasury Control	DAO (veTAI governance)
Launch Price (Public)	\$0.025
Fully Diluted Valuation (FDV)	\$25M

TAI acts as the **engine of coordination** within TalentAI:

- fuels all internal payments (AI assessments, NFT minting, subscription tiers);
- aligns long-term participants via staking and governance locks;
- redistributes platform value through revenue-backed buybacks.

3.1 Interview-to-Earn & Token Interaction Logic

TalentAI introduces a novel **Interview-to-Earn** model, a behavioral and economic loop where both users (candidates) and recruiters interact with AI agents in a tokenized environment. This framework blends *value creation*, *token utility*, and *incentive calibration* within the AI-driven assessment process.

TalentAI transforms the hiring process into a **tokenized, AI-driven economy** where interviews, performance, and reputation are all measurable economic signals. This model **Interview-to-Earn** aligns candidates, recruiters, and the AI infrastructure through verifiable engagement, token flow, and incentive calibration.

Pipeline Architecture & Dynamic Pricing

Every hiring process is structured as a **Pipeline**: a sequence of AI-based evaluation modules configurable by the client.

Each pipeline defines:

- The **number of stages** (screening, coding test, behavioral interview, verification).
- The **AI options** used (voice/video, context depth, language model tier).
- The **reward mode** and **performance scoring function**.

Dynamic pricing:

Each configuration automatically determines the TAI cost per interaction. This cost reflects computation, verification layers, and the economic weight of the assessment, not user status. All users pay the same base rate for a given pipeline type, ensuring fairness and transparency.

Example: Economic Pipeline

Parameter / Option	Range or Type	Description	Weight / Cost Coefficient
Base Fee	Fixed	Default pipeline setup (includes AI engine, scoring infra, and storage)	1,000 TAI
AI Tier	L1 / L2 / L3	Determines the complexity and latency of the interview agent. • L1 = basic text • L2 = multimodal (voice/video) • L3 = contextual (multi-turn)	×1 / ×1.5 / ×2
Verification Level	0–3	KYC, skill proof, anti-cheat & live proctoring layers. • L0 = none • L1 = KYC-light • L2 = Live face check • L3 = Behavioral signature	+0 / +0.3 / +0.6 / +1.0
Reward Model	Winner-takes-most / Proportional / Negative Exposure	Defines how the token pool is distributed to candidates. • <i>Winner-takes-most</i> : higher incentives but higher variance. • <i>Proportional</i> : steady incentive. • <i>Negative exposure</i> : burns unproductive interactions.	+0.2 / +0.1 / +0.4
Candidate Cap	10 – 500	Maximum number of candidates in the funnel. Scales cost logarithmically with volume.	$+0.1 \times \log_{10}(N/10)$
Feedback Loop	On / Off	Enables post-interview analytics & model improvement (used to train AI).	+0.25
Premium Data Retention	On / Off	Long-term storage of video/audio streams for audit purposes.	+0.15
DAO Visibility	Public / Private	Public pipelines contribute to DAO KPIs (minor discount).	–0.1

Configurable AI Pipeline

Parameter	Selected Option	Cost Factor	Partial Cost (TAI)
Base Fee	—	1.0	1,000
AI Tier	L2 (Voice/Video)	×1.5	1,500
Verification Level	L2 (Live check)	+0.6	600
Reward Model	Winner-takes-most	+0.2	200
Candidate Cap	150	+0.18	180
Feedback Loop	Enabled	+0.25	250
Premium Retention	Disabled	+0	0
DAO Visibility	Private	+0	0
→ Total	—	—	2,730 TAI = 74 USD (listing price)

So a recruiter building this mid-tier pipeline would **lock ≈ 2,730 TAI** (≈ 74 usd) in the DAO Treasury as **veTAI**. The locked position ensures transparency, fair access, and on-chain accounting of recruitment flow value.

Economic Impact

- **Scalability:** low entry price for SMEs, increasing linearly with complexity.
- **Accountability:** recruiters pre-fund their process → no unpaid candidate work.
- **Treasury utility:** all locked TAI support governance and future buybacks.
- **Reward elasticity:** DAO can adjust coefficients to stabilize network activity or prevent over-saturation.

The **client (recruiter)** deposits 43,200 TAI → the DAO locks it as veTAI.

When candidates engage, the **pipeline's performance logic** determines reward allocation:

- **Proportional reward:** all participants get partial payouts based on score.
- **Winner-takes-most:** only top-ranked candidates are rewarded.
- **Negative exposure:** low-ranked candidates forfeit part of their stake.

Each pipeline contributes to the DAO's **revenue forecasting model** (Business Plan Expectancy), feeding back into buybacks and liquidity provisioning schedules.

3.2 Candidate Layer & Economic Fairness

Each participant interacts with AI Agents through their **Soulbound Identity NFT**, which anchors:

- **LinkedIn or verified identity link,**
- **Soulbound CV (ERC-7255)** with immutable professional history,
- **Reputation score** based on consistency, completion rate, and peer feedback.

Real-time anti-cheat algorithms track:

- multi-accounting / AI farming attempts,
- anomaly detection in response time or behavioral signatures,
- "mercenary ratio" (max 10% tolerance).

The economic calibration ensures that 90% legitimate users remain **more profitable per hour** than token-farming behavior. If the cost/time ratio becomes unfavorable, the system adjusts pipeline quotas and staking yields dynamically.

3.3 User Quotas, Slashing & Reputation Consistency

TalentAI maintains user discipline through **quota and slashing mechanics**:

- Each candidate can hold **2 pending pipeline slots/day** (anti-hoarding).
- **Pending phase** prevents overuse or multi-application flooding.
- **Verified profiles** (soulbound & KYC-light) gain extended quotas.
- **Quota increase** possible via payment or staking of TAI.
- **Slashing mechanism** applies to users consistently failing interviews without valid justification.
- **Reputation NFTs** evolve based on historical reliability, accuracy, and consistency.

Reputation directly impacts:

- visibility in future pipelines,
- staking yield multipliers,
- DAO voting credibility (for veTAI holders).

Profile Validation & Access Control

Before interacting with any TalentAI pipeline, users must pass through the **Profile Validation Layer**, symbolized by the “Verified Pin” badge.

- **Verification Types:**
 - *KYC-light check* (document + LinkedIn validation)
 - *Skill proof or prior certification check*
 - *Behavioral anti-cheat verification* (face/video or typing signature)
- **Outputs:**
 - A **Soulbound ID NFT** anchoring the user’s verified identity.
 - A **Reputation Pin** (visual badge, upgradable) signaling trust level and reliability.
- **Economic Utility:**
 - Verified users have access to higher-tier pipelines and can stake/earn more TAI.
 - The verification badge acts as a **gatekeeper** for higher reward multipliers and reduced slashing risk.

The “Pin” (verification badge) thus acts as a *proof-of-honesty layer*, securing the Interview-to-Earn ecosystem against farming or multi-account exploitation.

3.4 Calibration & Behavioral Economics

TalentAI's reward system is modeled on **utility-maximizing engagement economics**.

- **Positive feedback** (good performance) → reward scaling.
- **Negative feedback** (failure) → reduced yield or temporary cooldown.
- **Calibration danger**: avoid over-rewarding the top 10% (mercenaries) while keeping the bottom 90% economically viable.
- **Expected hourly profitability** for real workers must exceed the *expected farming yield* for system health.

This economic equilibrium is maintained dynamically through:

- reward pool tuning,
- veTAI staking ratio,
- and DAO-approved buyback frequency.

4. Token Sale & Allocation

Initial Circulating Supply: ≈12% (120M tokens)

Initial Market Cap: ≈\$3.0M

Soft Cap: \$2.5M / Hard Cap: \$5M

Category	% Supply	Tokens	Price (USD)	Raise	FDV	Vesting	Lockup	Notes
Seed	8%	80M	\$0.010	\$800k	\$10M	12mo linear	2mo	Strategic partners & angels

TalentAI Token Allocation

4.6 Airdrop & PointsFi Program

TalentAI will launch an **Airdrop & Engagement Campaign** designed to reward real users and long-term contributors, not short-term speculators. The distribution will be structured through a **PointsFi model**, a **dynamic** quest-based reward system calibrated on measurable participation and fairness metrics.

Engagement Framework

Users earn *Points* by completing platform quests such as:

- completing verified AI assessments,
- referring qualified candidates or recruiters,
- submitting AI-agent feedback,
- holding or staking TAI for governance activity.

Points are **non-transferable** and later convertible to TAI through a reward pool tied to specific epochs.

Economic Calibration

The reward engine will be **calibrated using economic fairness indicators**, ensuring balanced distribution and sustainable value capture:

- **Gini Score targeting:** distribution tuned to avoid excessive wealth concentration;
- **Engagement-weighted yield:** higher conversion ratios for active, long-term contributors;
- **Dynamic issuance curve:** total airdrop emission aligns with DAO-approved monthly unlock budgets;
- **Anti-sybil controls:** KYC-light + on-chain reputation filters (via credential NFTs).

Strategic Objective

The airdrop is not a marketing gimmick but a **bootstrapping mechanism** to:

1. establish an early cohort of verified users and recruiters,
2. stimulate organic data collection and AI feedback loops,
3. synchronize user incentives with long-term token value creation.

The **PointsFi Layer** will become a permanent mechanism within TalentAI — serving as the foundation for loyalty, staking bonuses, and DAO reputation scoring.

5. Economic Design Overview

TalentAI's economy is based on a **closed value loop** ensuring self-sustainability. It combines three economic functions:

1. **Revenue-driven buybacks (income loop)**
2. **Staking & governance (value retention loop)**
3. **Liquidity-managed emissions (market stability loop)**

6. ve(33) Governance Model

6.1 Principles

Inspired by **Andre Cronje's ve(3,3)** framework, TalentAI's governance model rewards participants who lock tokens and commit long-term.

- Lock TAI → mint **veTAI (Voting Escrowed TAI)**
- Longer lock = higher voting power and yield
- DAO allocates weekly emissions based on **veTAI voting**
- Revenue from platform fees and buybacks flows back to veTAI holders

6.2 Equations

$$veTAI_i = TAI_i \times \frac{t_{lock,i}}{T_{max}}$$

$$E_i = E_{total} \times \frac{veTAI_i}{\sum_j veTAI_j}$$

Emissions (E) and rewards are therefore endogenous; they depend on governance participation.

6.3 Benefits for Investors

- Direct **yield exposure** to platform growth.
- Locked tokens reduce float → upward pressure on price.
- Governance rights over emission curve, buyback ratios, and treasury policy.
- Optional “veTAI + LP” combined staking for higher reward tiers.

7. Revenue Sharing & Buyback Mechanism

7.1 Flow Diagram

TalentAI Economic & Token Flow

Closed value loop powered by veTAl governance and revenue-backed buybacks

Closed Value loop powered by veTAl governance and revenue-backed buybacks

7.2 Economic Stability Layer

Buybacks automatically balance liquidity: when price drops, buyback frequency increases until the Liquidity Coverage Ratio (LCR) > 1.0.

Liquidity provisioning parameters are derived from Kaiko-style power-law depth functions:

$$Depth_{2\%} = k \times MC^\beta, \quad \beta \approx 0.45$$

anchored to **\$300k static depth at TGE**.

8. Token Emission & Depletion Policy

A controlled emission model ensures sustainability over time.

8.1 Emission Curve

$$Y(t) = Y_0 \times (Y_T/Y_0)^{t/T}$$

- Start annual yield: 15%
- End yield: 2% (after 15 years)
- Policy: exponential decay, flat thereafter

Rationale: The system starts inflationary (growth bootstrap) then transitions deflationary as revenue replaces emissions.

8.2 Reward Pool Depletion

- Initial pool: 150M TAI
- Half-life: ~9 years
- Replenished by 25% of platform revenue (buyback + redistribution)
- Continuous simulation tests ensure pool sustainability (see §13)

9. Liquidity Design

9.1 Initial Market Liquidity

- Initial depth: \$300–500k USD equivalent (TAI/USDC, TAI/HBAR)
- Market maker loan: \$1.5–2M managed across 3–4 CEXs
- Target Depth@2%: \$0.9M @ \$3M MC (LCR=1.12)
- Dynamic liquidity windows funded by revenue inflow and DAO votes

9.2 Dynamic Absorption Layer

Liquidity dynamically scales with market cap:

$$L_t = k \times (MC_t)^\beta$$

ensuring stability during unlock events. Simulations (Monte Carlo, 100 paths) are planned to test depletion and overflow behavior under variable price shocks.

To extend stability through exchanges, TalentAI will work with a **hybrid market-making structure** combining:

1. **Loan-based inventory** (MM holds TAI & USDC liquidity for managed depth).
2. **Retainer-based service** (monthly payment to maintain spreads, volume, and LCR thresholds).

Deployment roadmap (phased by exchange tier):

Phase	Venue Type	Target Liquidity	MM Loan Allocation	Retainer	Notes
Phase 1	DEX (SaucerSwap, HeliSwap)	\$300–500k	25%	Fixed retainer	Bootstrap depth & price feed
Phase 2	Tier-3 CEX (MEXC, Bitmart)	\$500–800k	30%	+20% retainer	Higher daily volume / pairs expansion
Phase 3	Tier-2 CEX (Kucoin, Gate)	\$1.2–1.5M	25%	+30% retainer	24/7 managed liquidity + auto-balancing
Phase 4	Tier-1 (Binance, Coinbase)	\$2–3M	20%	Variable retainer	Strategic visibility + institutional flows

MM incentives — revenue share + DAO KPI bonuses tied to:

- bid-ask spread <1.2%,
- min daily volume threshold,
- price deviation <3% between venues.

10. Market Calibration & Scenarios

Scenario 1 — Organic Growth

- Revenue CAGR: +220%
- Price grows from \$0.025 → \$0.12 over 24 months
- FDV: \$25M → \$120M
- Staking yield: 24–31%

Scenario 2 — Accelerated Enterprise Adoption

- Early 50+ enterprise subscriptions
- Quarterly buybacks \$300–400k
- Price path median \$0.20 by month 24

Scenario 3 — Adverse Unlock Shock

- Unlock >100M tokens (10% of supply) in bear market
- Overflow $\mu = -0.2 \rightarrow$ short-term drawdown -18%
- LCR auto-stabilized by 2× buyback trigger
- Recovery in <45 days under model parameters

11. Governance & Treasury Control

11.1 Governance Power

Each veTAI holder can propose and vote on:

- Weekly emission allocation
- Buyback percentage (default 25%)
- DAO treasury reinvestment and grants
- Emission slope or pause

Votes executed on Hedera via HCS-11 secure messages. **Governance cadence:** 7–14 days.

11.2 Treasury Policy

- Multi-sig secured by DAO Council (3/5 signers)
- Real-time analytics dashboard showing treasury flows
- On-chain auditing via Hedera Mirror Node

12. Roadmap

Stage	Period	Deliverables
Stage 1 – Foundation	Q4 2025	Token launch, initial liquidity, credential NFTs
Stage 2 – Governance	H1 2026	veTAI staking module, emission dashboard
Stage 3 – AI Marketplace	H2 2026	Launch of external agent marketplace & revenue-sharing
Stage 4 – DAO Full Autonomy	2027	Decentralized treasury control, advanced analytics

13. Risk Analysis & Simulation Requirements

To guarantee long-term sustainability, the following **quantitative tests** are planned using Nomiks' simulation suite:

13.1 Depletion Stress Tests

- Simulate reward pool under 3 revenue trajectories (pessimistic / base / optimistic).
- Measure exhaustion time, refill frequency, and emission sustainability.
- KPIs: Half-life, Reserve Ratio, Annual Net Emission.

13.2 Unlock Shock Tests

- Monte Carlo GBM price paths with unlock clusters.
- Evaluate drawdown depth, volatility spillover, and liquidity exhaustion probability.
- KPIs: Max Drawdown %, Recovery Days, Overflow Trigger Frequency.

13.3 Liquidity Coverage & Absorption

- Power-law liquidity curve vs circulating supply.
- Stress liquidity at 2× volatility or 10× unlock speed.
- Target: maintain LCR > 1.0 for 95% of simulations.

13.4 Scenario Analysis

- Bull case (fast adoption)
- Bear case (macro contraction)
- Neutral (steady growth)

Each scenario produces expected FDV, yield, and treasury coverage.

KPI	Pessimistic	Base	Optimistic
Half-Life (months)	12	15	19
NRSI	0.68	1.05	1.43
Avg LCR	0.87	1.08	1.26
Safe Zone Probability (LCR > 1)	74 %	92 %	97 %
Max Drawdown (95 %)	-42 %	-27 %	-18 %
Median Recovery (days)	46	28	21
Overflow Trigger Frequency	0.21	0.09	0.04

Mitigation Lever	Description	Effect on Risk
Marketing & Onboarding Campaigns	Coordinated unlock-phase marketing boosts transactional demand and buy pressure. Employer onboarding drives organic buybacks via job posting fees.	↑ Demand / offsets unlock shocks
Airdrop & QuestFi Calibrations	Airdrops distributed through <i>Quest-based engagement</i> (Proof-of-Participation & Skill Certification). Gini-balanced targeting ensures fair user distribution and reduces speculative dumping.	↓ Reward concentration / ↑ retention
Liquidity Bootstrapping	Phased liquidity deployment through hybrid MM (loan + retainer). Starts from DEX pools → Tier 3 CEX → Tier 1 exchanges. Liquidity loan = gradual release (60 % / 30 % / 10 %) aligning depth with volume growth.	↑ Depth coverage / ↓ slippage risk
veTAI Lock Incentives	Higher yields for long-term lockers reduce circulating supply, mitigating sell pressure and increasing protocol governance participation.	↓ Circulating float / ↑ governance stability

14. Value Accrual Summary

The **TAI** token captures value through:

1. Platform fee conversion → buybacks
2. Float compression via veTAI locks
3. Deflationary supply post-Year 3
4. Treasury re-injection and PoL ownership

$$P_{TAI}(t) = \frac{R_t \times \alpha_{BB}}{S_{circ}(t)} \times (1 - \beta_{burn})$$

As revenue grows faster than circulating supply, long-term token value appreciates *endogenously*, not through speculation but through cash-flow capture.

15. Competitive Positioning

Factor	TalentAI	Competitors (Revelo, Helius, Braintrust)
AI Conversational Agents	✓	Partial
Blockchain Credentials	✓	Rare
Tokenized Governance	✓ (veTAI)	✗
Revenue Sharing	✓	✗
Buyback-backed Deflation	✓	✗
Enterprise Integration (Hedera)	✓	Limited

TalentAI positions itself as the *decentralized infrastructure layer for trusted, AI-driven hiring* the future “AI x Work graph” for global employment.

15. Economic Insights

TalentAI’s Interview-to-Earn model creates measurable and recurring token demand driven by real-world hiring processes:

- Fair pricing per pipeline, independent of user status.
- Token burns and locks tied directly to productive actions.
- Anti-farming design keeps economic integrity.
- Reputation NFTs enable transparent career progression.
- DeFi integration transforms platform revenue into continuous buyback support.

Result: a fully closed economic loop where AI assessments, user reputation, and treasury mechanics mutually reinforce TAI’s long-term value.

16. Disclaimer

This document is not an offer or solicitation for securities. Token utility relates exclusively to platform usage, staking, and governance. Economic simulations are indicative and subject to change pending audit, stress testing, and DAO ratification.
